Site Visit Assessment Form – Oundle Big Meadow Field 1. Northamptonshire

Site Name	Grid Ref	County	
Oundle Big Meadow	TL03867651	Northamptonshire	
Catchment	Ownership	Designation	Size (ha)
Nene	John Gent	none	17 ha
Date	Meeting with	Managed by	
9 th June 2016	FMP Steering	John Gent	
	Group		

Management and History

Agri environment agreement

AG00292818

HK8

Current management

Annual hay cut followed by aftermath grazing

Restoration

Technique used/Dates

Sown with EM8 mix in 2010 on land that was formerly arable as farmer wanted more land for stock. 400 kg of seed was spread.

Hydrology	Floods regularly			
Historical information				
Current site interest	Attach excel spreadsheet for botanical data			
We visited in 2012, but did not collect any quadrat data. The Wildlife Trust have collected quadrat data from here – 10 quadrats across the field from the river to the hedge, possibly annually over 3-4 years but data currently unavailable. The farmers' sister is keen to start monitoring up again so BCN Wildlife Trust are going to do a				
transect with her next summer.				
The species diversity on the site is relatively high, varying from 17 to 23 species per square metre. MG9 of the NVC - Holcus lanatus-Deschampsia cespitosa grassland (typically found on permanently moist, gleyed and periodically inundated soils) — proved the best match from MAVIS. MG5 is also a good match for the community here, and is typically found in the drier end of the floodplain meadow community range. Both grasses and forbs get equal amounts of cover (20-30%). Yorkshire fog Holcus lanatus is dominant on some of the plots with 40% cover. Other abundant species include meadow foxtail Alopecurus pratensis, smooth brome Bromus racemosus, crested dog's-tail Cynosurus cristatus, rough meadow grass Poa trivialis, selfheal Prunella vulgaris, meadow buttercup Ranunculus acris, lesser trefoil Trifolium dubium, ribwort plantain Plantago lanceolata and creeping buttercup Ranunculus repens, thereby maintaining high diversity across the field.				
According to Ellenberg indicator scores, the soil on the field is not very fertile (N=5.16), and the soil moisture is not high (F=5.58). These scores make the site a very suitable habitat for an MG5 plant community.				
Phosphorus levels	Not known			
Soil auger photo and findings	None taken			
Site manager aspirations/objectives	<u> </u>			
More species rich grassland				

Management recommendations

Maintain management regime.

	Oundle Big Meadow
Ellenberg F	5.58
